

Bathing water results 2012 – Denmark

1. Reporting and assessment

In 2012 the Danish authorities reported under Directive 2006/7/EC provisions a list of their bathing waters, start and end of bathing season for each bathing water, short term pollution events, events impacting bathing water quality and measured values of concentrations of two microbiological parameters — intestinal enterococci and *Escherichia coli* (also known as *E. coli*). This report gives a general overview of bathing water quality in Denmark for the 2012 bathing season. Denmark has reported under the Directive 2006/7/EC since 2008.

When four consecutive years of samples of intestinal enterococci and *Escherichia coli* for bathing water are available, the assessment is done according to assessment rules of the new bathing water Directive 2006/7/EC. The Annex IV of the directive requires a sample to be taken shortly before the start of the bathing season. Sampling dates are to be distributed throughout the bathing season, with the interval between sampling dates never exceeding one month. Taking into account one pre-season sample, no fewer than four samples are to be taken and analysed per bathing season. Three samples need to be taken and analysed per bathing season in the case of bathing water with either bathing season not exceeding eight weeks or being situated in a region subject to special geographical constraints. The result of such monitoring is used to build up the sets of bathing water quality data. The number of samples for the assessment period should thus be at least 16 or 12 if season duration is less than eight weeks or the region is subject to special geographical constraints.

Bathing water quality in 2012 season in Danish is assessed under the rules of the new bathing water Directive 2006/7/EC. The new Directive assessment provisions are transformed into the following technical rules: a) one pre-season sample should be available, b) the interval between sampling dates in 2012 should never exceed 35 days, provided that the next sampling is done according to the monitoring calendar; c) the yearly number of samples in the previous years should be four or three if bathing season does not exceed eight weeks.

Bathing waters quality classes according to the Directive 2006/7/EC are 'excellent', 'good', 'sufficient' and 'poor'. Bathing waters are classified on the basis of the percentile values for microbiological enumerations falling in the certain class given in Annex I of the Directive. Some bathing waters cannot be classified according to their quality but are instead classified as 'insufficiently sampled', 'new', 'changes' and 'closed'.

The bathing water is classified as 'insufficiently sampled' in 2012 if pre-season sample is missing, sampling frequency is not satisfied or the set of data is not complete. If the bathing water is newly identified and the data set is not complete yet, it is classified as 'new'. If changes occur that affect quality and the data set is not complete yet, it is classified as 'changes'. Temporarily closed bathing waters or closed bathing waters throughout 2012 season are classified if there is a complete set of data available. Otherwise, they are classified as 'closed'.

2. Length of bathing season and number of bathing waters

For all bathing waters the bathing season lasted 92 days, from 1 June to 1 September 2012.

A total of 1 090 bathing waters were reported in Denmark during the 2012 bathing season, of which 973 were coastal bathing waters and 117 were inland bathing waters (0 on rivers; 117 on lakes). A total of 44 coastal and two inland bathing waters were reported as de-listed (permanently closed) compared to the previous year. Five coastal and one inland bathing waters were added to the list.

With 1 090 reported bathing waters Denmark accounts for about 5.2 % of the reported bathing waters of the European Union.

3. Bathing water quality

The results of the bathing water quality in Denmark for the period 1991-2012 are presented in Figure 1¹. The previous reports are available on the European Commission's bathing water quality website (http://ec.europa.eu/environment/water/water-bathing/index_en.html) and the European Environment Agency's bathing water website (<http://www.eea.europa.eu/themes/water/status-and-monitoring/state-of-bathing-water>).

Figure 1: Results of bathing water quality in Denmark from 1991 to 2012.

¹ The graphs show the classification under the Directive 76/160/EEC and during transition period, for coastal and inland bathing waters from 1991 to 2010:

- The percentage of bathing waters that comply with the guide values (class CG, blue line);
- The percentage of bathing waters that comply with the mandatory values (class CI, green line);
- The percentage of bathing waters that do not comply with the mandatory values (class NC, red line);
- The percentage of bathing waters that are banned or closed (class B, violet line).

The same graphs show the classification under the Directive 2006/7/EC, for coastal and inland bathing waters for 2011 and 2012:

- The percentage of bathing waters that have excellent quality (dark blue bar);
- The percentage of bathing waters that have good quality (light blue bar);
- The percentage of bathing waters that have sufficient quality (green bar);
- The percentage of bathing waters that have poor quality (red bar);
- The percentage of bathing waters that are closed (violet bar);
- The percentage of bathing waters that are insufficiently sampled, new or with changes (orange bar).

Note: Data until 2008 is available in the previous reports at http://ec.europa.eu/environment/water/water-bathing/index_en.html.

Table 1 and Table 2 show results of bathing water quality for coastal, inland and all bathing waters from 2008 on as assessed in the previous annual reports and under the Directive 2006/7/EC for the 2012 season. A map given in Appendix 1 shows the location and quality of the bathing waters.

Coastal bathing waters

In Denmark, 70.9 % of the coastal bathing waters were of excellent quality in 2012. This is an increase of 6.0 % compared to the previous year (2011). A total of 162 bathing waters (16.6 %) were of good quality and 55 bathing waters (5.7 %) were of sufficient quality compared to 197 (19.5 %) and 72 (7.1 %) in 2011 respectively. A total of 33 bathing waters (3.4 %) had poor quality compared to 39 (3.9 %) in 2011. No bathing waters (0.0 %) had to be closed during the season compared to 39 (3.9 %) and no (0.0 %) in 2011 respectively.

Inland bathing waters

Some 88.9 % of the inland bathing waters were of excellent quality in 2012. This is an increase of 5.8 % compared to the previous year (2011). Two bathing waters (1.7 %) were of good quality and two bathing waters (1.7 %) were of sufficient quality compared to five (4.2 %) and three (2.5 %) in 2011 respectively. One bathing waters had poor quality (0.9 %) and no bathing waters (0.0 %) had to be closed during the season compared to one (0.8 %) and no (0.0 %) in 2011 respectively.

Table 1: Results of bathing water quality in Denmark. Assessment during transition period.

DK												
		Total number of bathing waters	Compliance with guide and mandatory values*		Compliance with mandatory value		Not compliant		Banned/closed		Insufficiently sampled or not sampled

4. Important information as provided by the Danish authorities

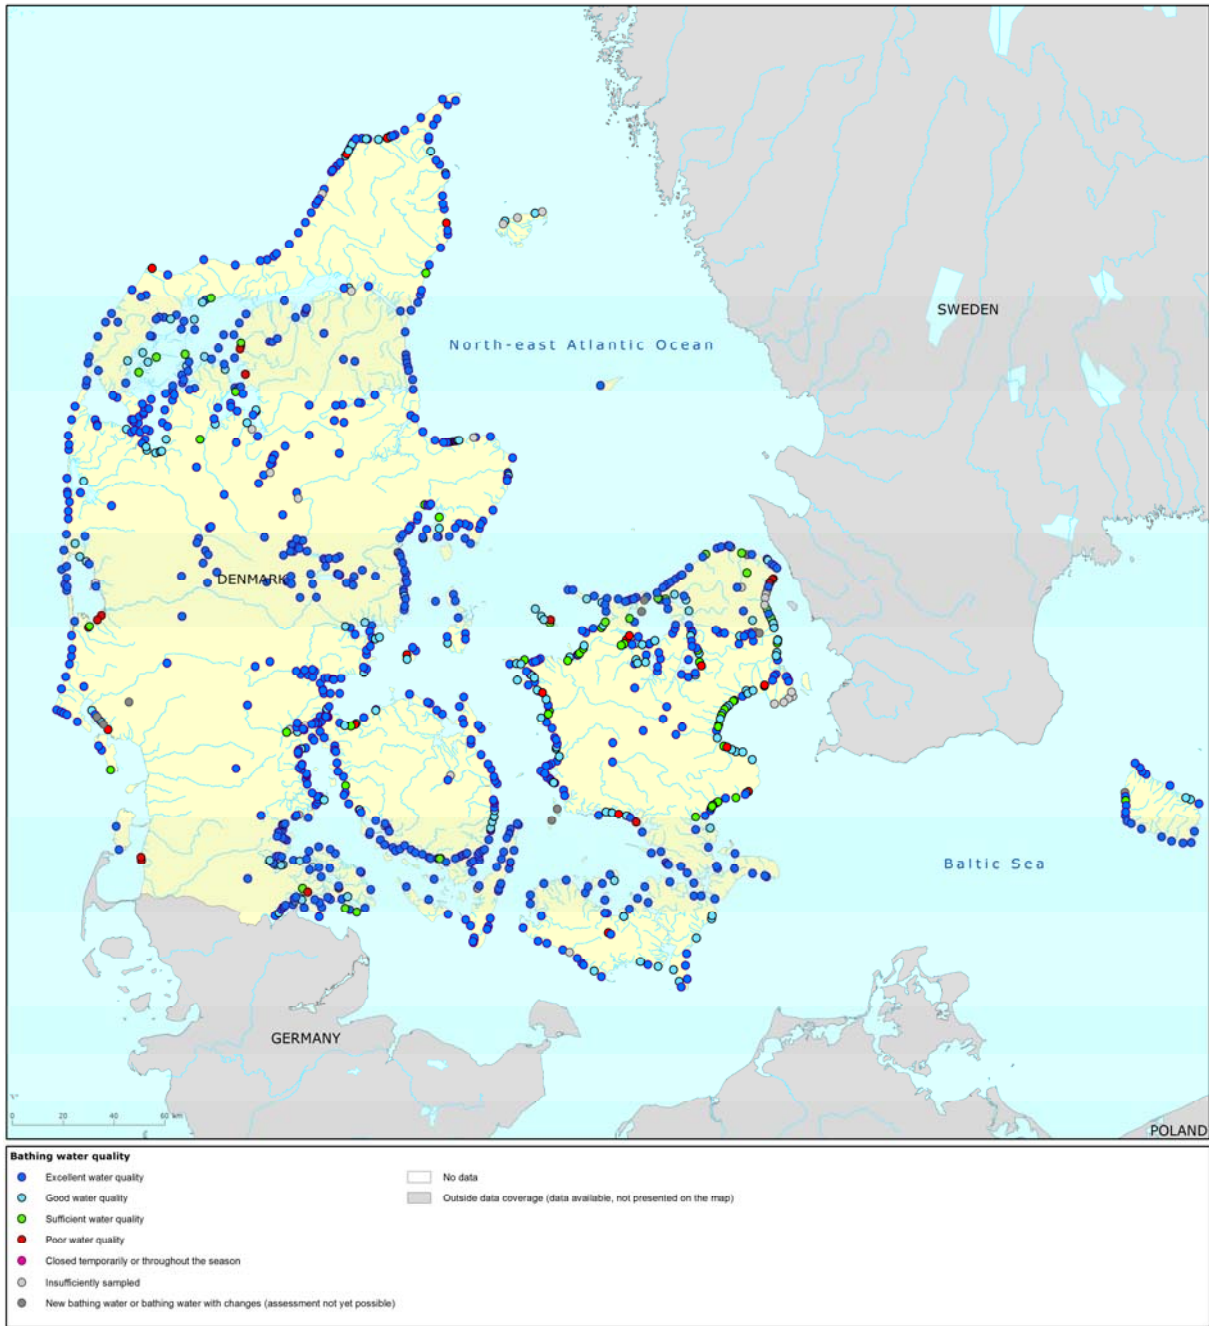

The Danish authorities have provided a separate document (http://cdr.eionet.europa.eu/dk/eu/nbwd/envunf77q/Annex_to_Change_2012_Denmark.doc) with a list of bathing waters being newly established or closed, changed in name or location, or being included in a new group. 16 bathing water profiles have been established and made publicly available online.

There are 34 bathing waters in poor quality reported for 2012, the majority of them being coastal waters:

BWID	BW name	Type	2012 status
DKBW1089	AUGUSTENBORG FJORD V/MADESKOVEN	Coastal	poor
DKBW1101	KONGSTRUP STR., SEJERØ	Coastal	poor
